DEVNAG font
(Hindi, Marathi, Sanskrit)

itrans
©1991–1998 Avinash Chopde

1 Fonts Available

1.1 TeX Interface

This devanagari font *devnag* is a Metafont font, developed by Frans Velthuis, and his package is called “Devanagari for TeX”.

The *devnag* font is in a archive named **devnag** or **devanagari**. It is available at all CTAN TeX archives in the languages directory. At the time of writing this document (2001), it was certainly available at [ftp.cdrom.com](ftp://cdrom.com), ctan.tug.org, and many other sites. Please use your Internet search tools to locate the CTAN site closest to you for downloading the *devnag* archive.

This font is not bundled with the *itran*s package, but is available at many FTP sites, including in the *texlive* package.

This ITRANS package make use of Velthuis’s Devanagari for TeX package, version 2.15 (released 2008). This contains a change from the previous 1.6 version - the font family **dvn**b is used instead of **dvng**. This is required to get the correct *j~na* and *GYa* consonant variations.

Devnag also has another Metafont file (*dvpn10.mf*) which generates a variation of the Devnag font. If you have Metafont on your system, you may use it to generate the PK and TFM files for TeX. This variation was developed by Thomas Ridgeway, and in his words, it is “a trivial variation of *dvn*b10.mf to resemble devanagari written with an ordinary writing pen”. Looks nice.

Note that the *dvpn10.mf* file alone is insufficient to generate the TeX font, the complete *devnag* package is required to make it usable. And, you must know enough about Metafont to run it.

Important: *itran*s does not automatically handle all the ligatures present in the *devnag* font. The Devnag font does contain many three- and four- consonant ligatures, most of which are not currently supported using *itran*s. See the section titled “Limitations” for more details.

1.2 Direct Textual Interface - HTML

HTML interface is supported using this font, Unicode (UTF-8) is supported for this the Devanagari script, but no Unicode fonts are included with the ITRANS package.

Since this is a TeX font, this interface cannot be used as is for HTML. But, Sandeep Sibal, developer of the Jtrans package, has made available a font named Xdvng, which is derived from the dvng/dvn**b** fonts, and which allows use of Xdvng with the direct Text HTML output mode of ITRANS. See the example files for HTML output in the ITRANS doc directory (ITRANS/doc/s1html.itx); the IFM file to use is named *xdvng.ifm*. The IFM file has been developed by Sandeep Sibal, and the Xdvng font (available for multiple platforms) has been developed by Sandeep Sibal and Arun Gupta See <http://www.sibal.com/sandeep/jtrans/> for info on Sandeep Sibal’s Jtrans package.

⁰Last modification: December 4, 2009

1.3 Text Interface - Unicode (UTF-8) for Sanskrit, Hindi, and Marathi

IFM file to use is named *dvng.ifm*.

Unicode (UTF-8) output is supported for this the Devanagari script, but no Unicode fonts are included with the ITRANS package. There are many Unicode fonts available on the Web, and more are being developed so it should be easy to locate a Unicode font when needed. Not all Unicode fonts fully support Indian Languages yet.

1.4 Sanskrit (or Hindi) and Marathi

The IFM file *dvng.ifm* can be used for Sanskrit, Hindi or Marathi output.

The marathi form of ra-half is available through the R character and the second LA is at L (or 1d), etc. The tables (1 and 7) display the complete mapping from English to Devanagari for all the three Indic Scripts.

A second IFM file is also provided, *dvngfull.ifm*, and is meant to be used for text that needs to use many archaic consonant conjunct forms. Use this file only if you really need all the consonant conjuncts; in most cases a smaller set of consonant conjuncts, as defined by the dvng.ifm file suffices. The tables that follow include information on which conjunct glyphs are available using which IFM file. dvng.ifm file is the one most commonly used, since this has the “best” set of ligatures.

2 Font Developer

This font has been created by Frans Velthuis as part of his “Devanagari for TeX” package. He holds copyright to the fonts in the package. I would like to thank him for making it available as freeware.

Frans Velthuis

University of Groningen

The Netherlands

e-mail address: velthuis@rc.rug.nl (Frans J. Velthuis)

Since 1990, many other people have worked to enhance the original “Devanagari for TeX” package, the current version is being supported by John Smith and Anshuman Pandey.

Table 7 shows the ITRANS encoding in a compact table, this table was sent in by Ashok Basargekar, and it is similar in layout to the table included with the documentation in the original Velthius Devanagari for TeX package.

3 Limitations

As mentioned in the first section, *ittrans* makes use of only a subset of the ligatures available in the Devnag font. *ittrans* only recognizes two-consonant ligatures, and most ligature of more than two consonants is ignored.

The two tables (in tables 4 and 5) display the ligatures that are being used in ITRANS. All the ra-<consonant> and <consonant>-ra ligatures are not displayed in the available list, but they are handled by *ittrans* correctly.

Table 6 displays ligatures that are not used, along with their decimal character codes (glyph positions).

ITRANS versions 5.1 and newer do support three- or more consonant conjuncts, so, it is technically possible to support all these conjuncts, but to keep things simple, I am currently simply

Table 3: More Examples

ignoring these complex glyphs. If there are a few conjuncts that are important enough to be included, let me know, and will add those definitions to the dvng.ifm file. I have added a few such conjuncts to dvng.ifm and dvngfull.ifm files, the tables 4 and 5 show all supported conjuncts.
